Detailed product card

Filter products in the catalog

Quick start of mobile application

The Opencart mobile app-made in the mobile app designer, provides its own mobile app for Android and IOS. We have created a module based on the standard REST API that connects the Android mobile app and the IOS app. All information about the product, customer and order of the Opencart store will be synchronized with the mobile application

This app will provide its customers with a variety of features to make their shopping more convenient and mobile, to ensure widespread distribution

(over easy access to information in real-time), Convenience (devices that store data are always at hand), Availability (choice to limit accessibility to certain individuals with whom you can contact at any time in any place), Personalization (Creating services that customize the end user experience) and Localization (Mapping services location clients)

It is possible that customers will not get access to options such as information pages, emails, etc. When needed, but since the mobile phone has become a necessity in today's world and everyone has the same in their hands, so the Opencart mobile app will provide an instant connection to buyers with notifications, offers and deals just at this stage.
